Note (2) The specified temperature range is determined by the design of the product set. When integrated with the customer's system, it is imperative to control environmental conditions within this prescribed range; otherwise, the operational capability of the product cannot be guaranteed.

Note (3) Surface temperature is measured at 60 °C dry condition.

Note (4) Thermal management should be considered in final product design to prevent the surface temperature of display area from being over 70°C. The range of operating temperature may degrade in case of improper thermal management in final product design.

## 2.2 PACKAGE STORAGE

When storing modules as spares for a long time, the following precaution is necessary.

- (a) Do not leave the module in high temperature, and high humidity for a long time, It is highly recommended to store the module with temperature from 0 to 35 °C at normal humidity without condensation.
- (b) The module shall be stored in dark place. Do not store the TFT-LCD module in direct sunlight or fluorescent light.

Note (1) The module should be always operated within the above ranges. The ripple voltage should be controlled under 10% of  $V_{cc}$  (Typ.)

Note (2) Measurement Conditions :

Note (3) The specified power supply current is under the conditions at  $V_{cc} = 12\text{ V}$ ,  $T_a = 25 \pm 2\text{ }^{\circ}\text{C}$ ,  $f_v = 60\text{ Hz}$ , whereas a power dissipation check pattern below is displayed.

a. White Pattern

Active Area

b. Black Pattern

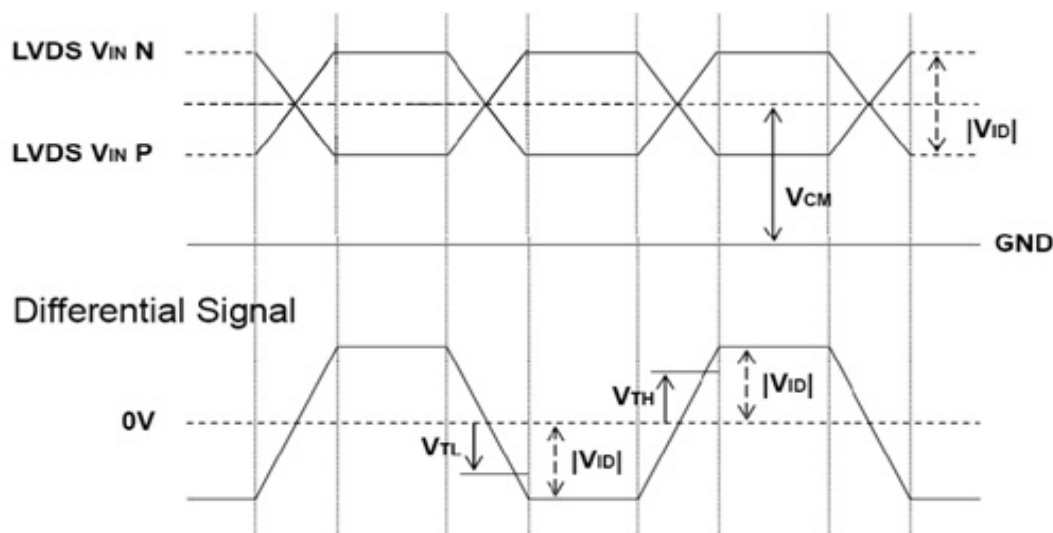

Active Area

c. Horizontal Pattern

Note (4) The LVDS input characteristics is shown as below : The position of measurement is TCON LVDS input pin.

The differential voltage must be higher than  $V_{TH}$  and lower than  $V_{TL}$  to ensure that the receiver indicates a valid logic state at its output.

## 3.2 BACKLIGHT CONVERTER UNIT

### 3.2.1 CONVERTER CHARACTERISTICS

Parameter	Symbol	Value			Unit	Note
		Min.	Typ.	Max.		
Power Consumption	$P_{BL}$	-	74	86	W	(1), (2)
Converter Input Voltage	VBL	22.8	24	25.2	VDC	
Converter Input Current	$I_{BL}$	-	3.1	3.6	A	Non Dimming
Input Inrush Current	$I_R$	-	-	TBD	A <sub>peak</sub>	$V_{BL}=22.8V_T$ (3)
Dimming Frequency	FB	150	-	170	Hz	
Dimming Duty Ratio	DDR	5	-	100	%	(4)
Life Time	-	50,000		-	Hrs	(5)

Note (1) The power supply capacity should be higher than the total converter power consumption  $P_{BL}$ . Since the pulse width modulation (PWM) mode was applied for backlight dimming, the driving current changed as PWM duty on and off. The transient response of power supply should be considered for the changing loading when converter dimming.

Note (2) The measurement condition of Max. value is based on 37" backlight unit under input voltage 24V

Note (3) For input inrush current measure, the VBL rising time from 10% to 90% is about 20ms.

Note (4) EPWM signal have to input available duty range. 5% minimum duty ratio is only valid for electrical operation.

Note (5) The lifetime is defined as the time which luminance of the LED decays to 50% compared to the initial value,

Operating condition: Continuous operating at  $T_a = 25 \pm 2^\circ\text{C}$

Note (6) Below diagram is only for power supply design reference.

Test Condition :  $V_{BL} = 22.8V$  at 2D Mode

		T <sub>on1</sub>	—	300	—	—	ms		
BLON Off Time		Toff	—	300	—	—	ms		

Note (1) The Dimming signal should be valid before backlight turns on by BLON signal. It is inhibited to change the external PWM signal during backlight turn on period.

Note (2) The power sequence and control signal timing are shown in the Fig.1. For a certain reason, the converter has a possibility to be damaged with wrong power sequence and control signal timing.

Note (3) While system is turned ON or OFF, the power sequences must follow as below descriptions:

Turn ON sequence: VBL → PWM signal → BLON

Turn OFF sequence: BLOFF → PWM signal → VBL

Note (4) When converter protective function is triggered, ERR will output open collector status. (Fig.2)

Note (5) The EPWM interface that inserts a pull up resistor to 5V in Max Duty (100%), please refers to Fig.3.

Note (6) EPWM signal have to input available frequency range.

$$F_{clk_{in}}(\max) \geq F_{r6} \times T_v \times T_h$$

$$F_{r5} \times T_v \times T_h \geq F_{clk_{in}}(\min)$$

Note (2) This module is operated in DE only mode and please follow the input signal timing diagram as below :

Note (3) The input clock cycle-to-cycle jitter is defined as below figures.  $Trcl = |T_1 - T|$

Note (4) The SSCG (Spread spectrum clock generator) is defined as below figures.

Note (5) The LVDS timing diagram and the receiver skew margin is defined and shown in following figure.

**LVDS RECEIVER INTERFACE TIMING DIAGRAM**

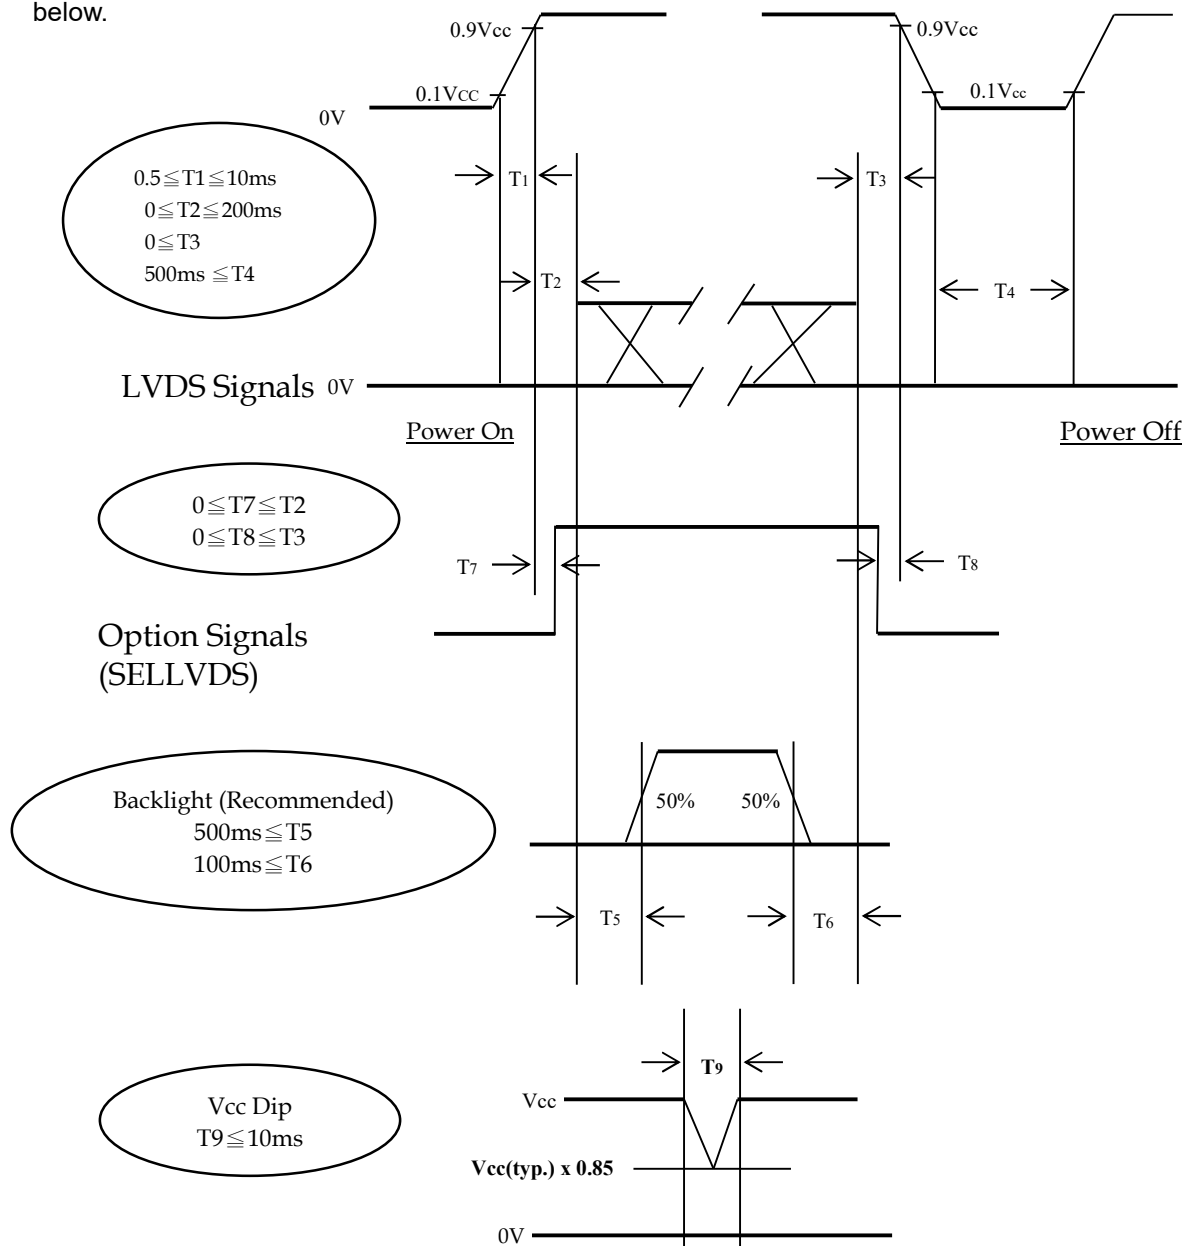

Note (6) For primitive resolution 1920\*540, typical  $T_{vd}$  should be 1080 Th , image display at  $T_{vd}$  541 to 1080 lines is invalid .

## 5.2 POWER ON/OFF SEQUENCE

( $T_a = 25 \pm 2^\circ\text{C}$ )

To prevent a latch-up or DC operation of LCD module, the power on/off sequence should be as the diagram below.

Note (1) The supply voltage of the external system for the module input should follow the definition of V<sub>cc</sub>.

Note (2) Apply the LED voltage within the LCD operation range. When the backlight turns on before the LCD operation or the LCD turns off before the backlight turns off, the display may momentarily become abnormal screen.

Note (3) In case of VCC is in off level, please keep the level of input signals on the low or high impedance.

If  $T_2 < 0$ , that maybe cause electrical overstress failure.

Note (4) T<sub>4</sub> should be measured after the module has been fully discharged between power off and on period.

Note (5) Interface signal shall not be kept at high impedance when the power is on.

Note (6) V<sub>cc</sub> must decay smoothly when power-off.

## 6. OPTICAL CHARACTERISTICS

### 6.1 TEST CONDITIONS

Item	Symbol	Value	Unit
Ambient Temperature	Ta	25±2	°C
Ambient Humidity	Ha	50±10	%RH
Supply Voltage	VCC	12±1.2	V
Input Signal	According to typical value in "3. ELECTRICAL CHARACTERISTICS"		
Vertical Frame Rate	Fr	60	Hz

The LCD module should be stabilized at given temperature for 1 hour to avoid abrupt temperature change during measuring in a windless room.

## 6.2 OPTICAL SPECIFICATIONS

		θ <sub>x</sub> -		80	89	-		
	Vertical	θ <sub>y</sub> +		80	89	-		
		θ <sub>y</sub> -		80	89	-		

Note (1) Definition of Viewing Angle ( $\theta_x, \theta_y$ ):

Viewing angles are measured by Autronic Conoscope Cono-80 (or Eldim EZ-Contrast 160R).

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = \frac{\text{Surface Luminance of L255}}{\text{Surface Luminance of L0}}$$

L255: Luminance of gray level 255

L 0: Luminance of gray level 0

CR = CR (5), where CR (X) is corresponding to the Contrast Ratio of the point X at the figure in Note (6).

Note (3) Definition of Gray-to-Gray Switching Time :

The driving signal means the signal of gray level 0, 31, 63, 95, 127, 159, 191, 223 and 255.

Gray to gray average time means the average switching time of gray level 0, 31, 63, 95, 127, 159, 191, 223 and 255 to each other.

Note (4) Definition of Luminance of White (LC, LAVE) :

Measure the luminance of gray level 255 at center point and 5 points

LC = L (5), where L (X) is corresponding to the luminance of the point X at the figure in Note (6).

Note (5) Definition of Cross Talk (CT) :

$$CT = |Y_B - Y_A| / Y_A \quad 100 (\%)$$

Where:

$Y_A$  = Luminance of measured location without gray level 255 pattern (cd/m<sup>2</sup>)

$Y_B$  = Luminance of measured location with gray level 255 pattern (cd/m<sup>2</sup>)

Note (6) Definition of White Variation (  $W$  ) :

Measure the luminance of gray level 255 at 5 points

$$W = \frac{\text{Maximum } [L(1), L(2), L(3), L(4), L(5)]}{\text{Minimum } [L(1), L(2), L(3), L(4), L(5)]}$$

## 7. PRECAUTIONS

### 7.1 ASSEMBLY AND HANDLING PRECAUTIONS

- [1] Do not apply rough force such as bending or twisting to the module during assembly.
- [2] Do not apply pressure or impulse to the module to prevent the damage of LCD panel and Backlight.
- [3] Bezel of Set can not press or touch the panel surface. It will make light leakage or scrape.
- [4] It should be attached to the system firmly using all mounting holes.
- [5] It is recommended to assemble or to install a module into the user's system in clean working areas. The dust and oil may cause electrical short or worsen the polarizer, do not press or scratch the surface harder than a HB pencil lead.
- [6] Use finger-stalls with soft gloves in order to keep display clean during the incoming inspection and assembly process.
- [7] Protection film for polarizer on the module should be slowly peeled off just before use so that the electrostatic charge can be minimized.
- [8] Do not disassemble the module.
- [9] Always follow the correct power-on sequence when the LCD module is turned on. This can prevent the damage and latch-up of the CMOS LSI chips.
- [10] Do not plug in or pull out the I/F connector while the module is in operation, pins of I/F connector should not be touched directly with bare hands. Do not adjust the variable resistor located on the module.
- [11] Moisture can easily penetrate into LCD module and may cause the damage during operation.
- [12] When storing modules as spares for a long time, the following precaution is necessary.
  - [12.1] Do not leave the module in high temperature, and high humidity for a long time. It is highly recommended to store the module with temperature from 0 to 35°C at normal humidity (under 70%) without condensation.
  - [12.2] The module shall be stored in dark place. Do not store the TFT-LCD module in direct sunlight or fluorescent light.
- [13] When ambient temperature is lower than 10°C, the display quality might be reduced. For example, the response time will become slow, and the starting voltage of LED will be higher than that of room temperature.
- [14] Use a soft dry cloth without chemicals and Ethyl Alcohol for cleaning, because the surface of polarizer is very soft and easily scratched. Do not use Ketone type materials (ex. Acetone), Toluene, Ethyl acid or Methyl chloride, these chemical solvent might permanently damage the polarizer due to chemical action.

## 7.2 SAFETY PRECAUTIONS

To optimize PID module's lifetime and functions, operating conditions should be followed as below

[1] Normal operating condition

[1.1] Temperature :  $20 \pm 15^{\circ}\text{C}$

[1.2] Humidity :  $55 \pm 20\%$

[1.3] Well-ventilated place is suggested to set up PID module and system.

[1.4] Display pattern : regular switched patterns or moving pictures.

[2] Operation usage to protect against image sticking due to long-term static display.

[2.1] Suitable operating time : under 24 hours a day.

(\* The moving picture can be allowed for 24 hours a day)

[2.2] Liquid Crystal refresh time is required. Cycling display between 5 minutes' information (static) display and 10 seconds' moving image.

[2.3] Periodical display contents should be changed from static image to moving picture.

[2.3.1] Different background and image colors changed respectively, and changed colors periodically.

[2.3.2] Background and image with large different luminance displayed at the same time should be avoided.

[2.3.3] Periodical power-off the system for a while or screen saver is needed after long-term static display.

[2.3.4] Moving picture or black pattern is strongly recommended for screen saver.

[3] The startup voltage of a Backlight may cause an electrical shock while assembling with the converter. Do not disassemble the module or insert anything into the Backlight unit.

[4] Do not connect or disconnect the module in the "Power On" condition.

[5] Do not exceed the absolute maximum rating value. (supply voltage variation, input voltage variation, variation in part contents and environmental temperature...) Otherwise the module may be damaged.

[6] If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.

[7] Module should be turned clockwise (front view perspective) when used in portrait mode.

**Landscape (Front view)**

**Portrait (Front view)**

[8] Ultra-violet ray filter is necessary for outdoor operation.

[9] Only when PID module is operated under right operating conditions, lifetime in this spec can be guaranteed.

After the module's end of life, it is not harmful in case of normal operation and storage.

[10] LCD system is required to place in well-ventilated environment. Adapting active cooling system is highly recommended.

[11] Product reliability and functions are only guaranteed when the product is used under right operation usages.

If product will be used in extreme conditions, such as high temperature/humidity, display stationary patterns, or long operation time etc..., it is strongly recommended to contact INX for filed application engineering advice. Otherwise, its reliability and function may not be guaranteed. Extreme conditions are commonly found at airports, transit stations, banks, stock market and controlling systems.

### 7.3 PRECAUTIONS FOR STRONG LIGHT EXPOSURE

Strong light exposure causes degradation of polarizer and color filter. Since the product design is not protected by an ultra-violet ray filter, the deterioration of the polarizer due to sun exposure or water drenching is not guarantee. It is necessary to set up cover-glass with ultraviolet resistance to protect panel from radiation of ambient environment.

### 7.4 SAFETY STANDARDS

The LCD module should be certified with safety regulations as follows:

Regulatory	Item	Standard
Audio/video, Information and Communication Technology Equipment	UL	UL 62368-1, 3rd Edition, 2021-10-22
	cUL	CAN/CSA C22.2 No. 62368-1:19, 3rd Edition, 2021-10-22
	CB	IEC 62368-1:2018 EN IEC 62368-1:2020+A11:2020

If the module displays the same pattern for a long period of time, the phenomenon of image sticking may be occurred.

### 7.5 DUST RESIST

[1] INX module dust test is conducted with marked holes (see Figure 7.4, marked with a water blue) sealed to comply with JIS D 0207.

[2] Module users should design set with these holes used/sealed (if not used) or covered by set mechanism to prevent dust from entering. The INX testing procedure cannot replicate all different real world scenarios, module users should apply set dust resistance solution to meet user's requirement.
